

SWIFT & SwiftUI

#project App iOS

swift

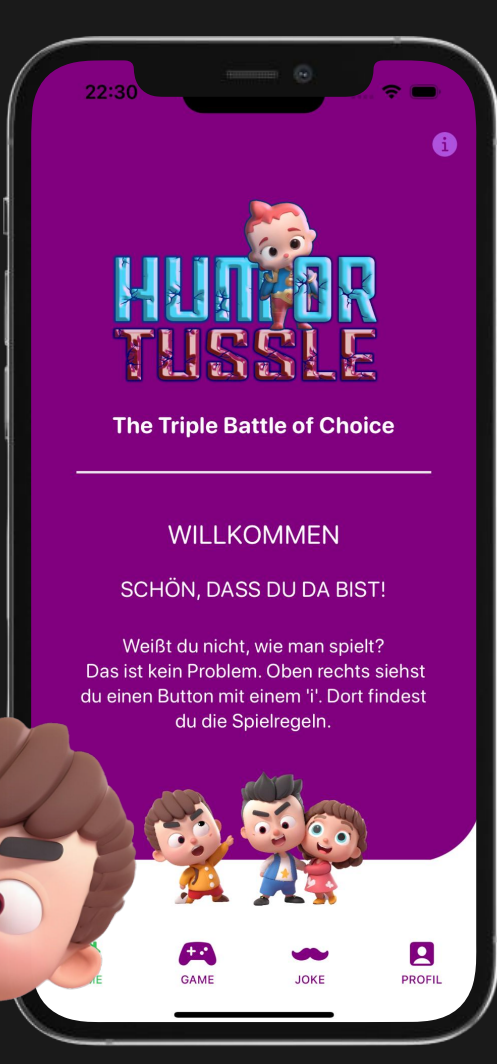

KI 42

Finished iOS App in XCode with Swift and SwiftUI mit Final Presentation

during the game

To maintain interest and avoid the risk of boredom, we use 6 different children, each with their own desire: if both players have selected the same one. This means that the list with the 6 different GifImageView() where to create with Ai generation will randomly display one of them each time.

Design

Typography

For the typography of our app, for example, we use the font 'Poppins', which offers a modern and clean design. For example, we use the standard font 'SF' from Apple for the typography of our app.

Size

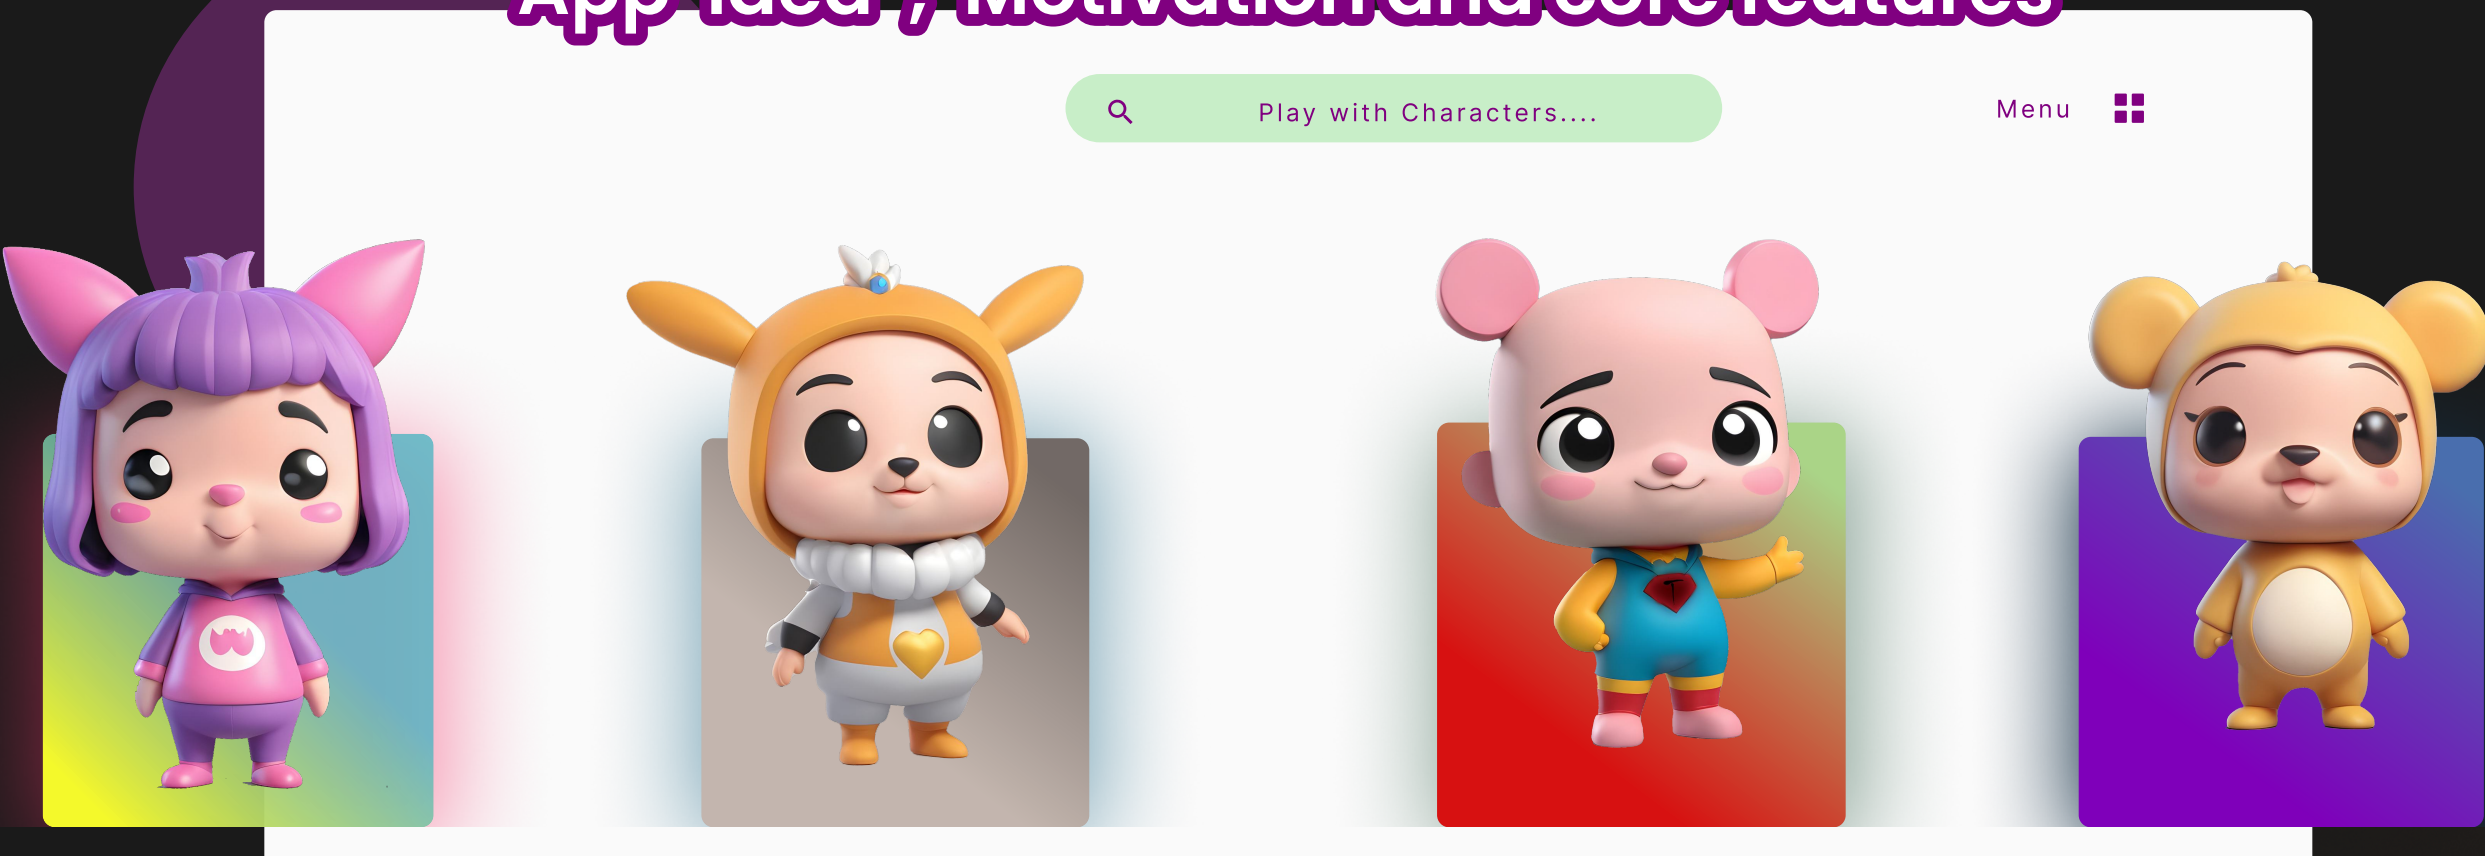

We use several variants for the font sizes. With .dynamicTypeSize(.xxxL arge) we can adjust the text size to the user's preferences, while .font(.largeTitle) creates a large title with a bold font.

Style

In addition, we use the .bold() and .fontDesign(.rounded) styles to emphasize the text. With these combinations, we offer our users a typographic experience that is equally legible, appealing and responsive.

App Idea , Motivation and core features

- The idea behind my app is to bring a forgotten game back to the forefront and provide a unique and fun experience with the popular and my some characters cartoon.
- How to play: Choose one of the 35 characters, start the game with or without music and defeat your opponent to earn points. The points are saved in your profile.
- In your profile, you can edit your personal information, share the app with friends and change your settings.

Technical part

Api Code

You can also read out random jokes from the JOKE API in English to make the game even more entertaining! Every time you press the mini button, you'll see a different joke.

Firebase

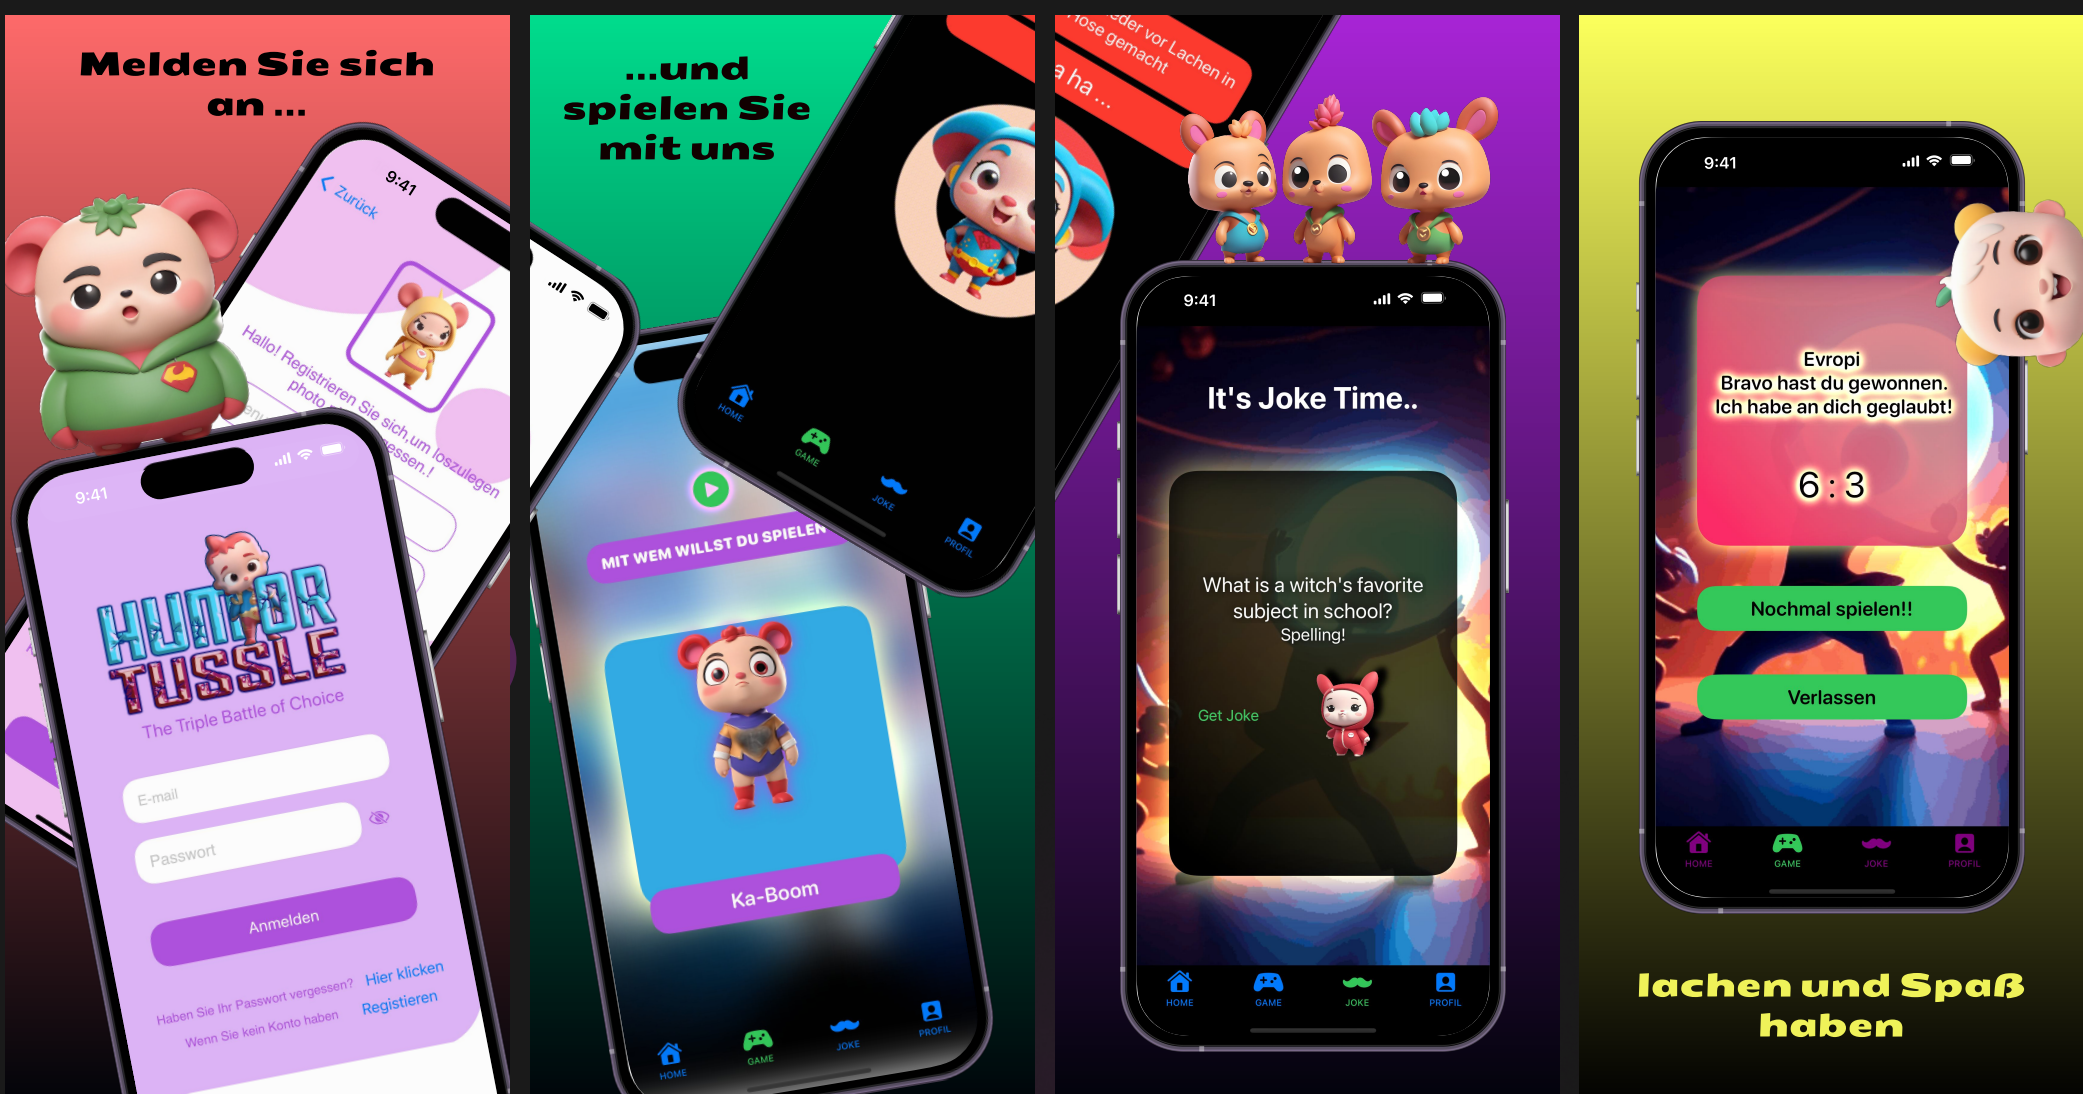

With Firebase we store data such as the user's name, email, location, score if he has won, image and password, he has the option to change his password in our app such as delete account or delete and save data.

Dark and light mode
